ARDEX FDX™
Full Depth Extended Repair Mortar
Concrete Repair Mortar with Corrosion Inhibitor

Portland cement-based structural repair mortar with integral corrosion inhibitor
Pre-measured aggregate increases productivity
Mix with water only
Easy to apply – formable, pourable and pumpable
Installs from 1 1/2” to 8”
Suitable for overlays and full depth repairs
Freeze-thaw resistant
Suitable for commercial, institutional and multi-unit residential applications
Use for exterior and interior concrete repair
Apply coatings in as little as 72 hours after application
ARDEX FDX™ Full Depth Extended Repair Mortar
Concrete Repair Mortar with Corrosion Inhibitor

Description and Usage
ARDEX FDX™ is a formable, pourable, pumpable, Portland cement-based structural repair mortar for horizontal, vertical and overhead applications for exterior and interior concrete above, on or below grade. ARDEX FDX contains pre-blended aggregate for precise jobsite control. It is used at depths ranging from 1 1/2” to 8”, has a corrosion inhibitor built-in to protect reinforcing steel, is easy to apply, and readily bonds to concrete. The resulting patch has low shrinkage and resists delamination. Typical applications include balconies, plaza decks, columns, walls and parking decks.

Substrate Preparation
Prior to proceeding with any repair, please refer to the International Concrete Repair Institute’s ICRI Guide for Surface Preparation for the Repair of Deteriorated Concrete Resulting from Reinforcing Steel Corrosion; ICRI Guideline for Selecting and Specifying Concrete Surface Preparation for Sealers, Coatings, and Polymer Overlays; and the American Concrete Institute’s ACI 546R-04 Concrete Repair Guide for general guidelines for concrete repair.

The repair area must be saw cut in a basic rectangular shape to at least 1 1/2” in depth. The cuts should be made at approximately a 90° angle, and should be slightly keyed. Chip out the concrete inside the cuts to a minimum depth of 1 1/2” until the area is squared or boxed in shape.

All substrates must be solid, thoroughly clean and free of oil, wax, grease, asphalt, existing patching materials, curing and sealing compounds, and any contaminant that might act as a bond breaker. Over watered, frozen or otherwise weak concrete surfaces must also be cleaned down to sound, solid concrete by mechanical methods such as scarifying or similar in accordance with ICRI to create an exposed aggregate surface with a minimum surface profile of approximately 1/16” (1.6 mm). Acid etching, solvents, sweeping compounds and sanding are not acceptable means of preparing the substrate.

For cases with exposed reinforcing steel, mechanically clean the steel to remove all rust and any other contaminants in accordance with ICRI. Prime the steel with ARDEX BONDING & ANTI-CORROSION AGENT™ prior to proceeding with the repair. For further details, please refer to the ARDEX Technical Brochure.

Cracks and Joints
Saw cuts and dormant cracks greater than 1/16” (1.6 mm) should be filled with an ARDEX ARDIFIX™ joint filler or similar prior to installing ARDEX FDX. The joint filler should be installed in strict accordance with the instructions provided by the filler manufacturer. The filling of dormant cracks and joints as described is recommended to help prevent telegraphing. However, should movement occur, cracks and joints will reappear.

All moving joints and cracks must be carried up through the ARDEX FDX by installing a flexible sealing compound specifically designed for use over moving joints, such as ARDEX ARDISEAL™ RAPID PLUS joint filler or similar.

Recommended Tools
A 1/2” to 3/4” (12 to 19 mm) low speed heavy-duty mixing drill, heavy gauge square box (butterfly) mixing paddle, mixing buckets, measuring container, margin trowel, wood or magnesium float, steel trowel and wood planking for forming. Also suitable for mixing in forced action mortar mixers.

Priming
If ARDEX BONDING & ANTI-CORROSION AGENT is specified as a primer, follow the application instructions in the ARDEX Technical Brochure.

If this primer is not used, dampen the concrete to be repaired until it is thoroughly saturated. Do not leave any bare spots. Brush or vacuum off puddles and excess liquid. The goal is to saturate the pores of the concrete while leaving the surface free of water (SSD, Saturated Surface Dry). Alternatively, ARDEX P 71™ PRIMER can be used in accordance with the ARDEX Technical Brochure. Do not allow the concrete or ARDEX P 71 to dry before installing the ARDEX FDX. Installing the mortar over a surface that is too dry can result in cracking and bond failure.

Mixing and Application
Pre-dampen the inside of a pail or the inside of a clean mortar mixer, and remove any excess water. Pour in 6 1/2 pints (3.08 L) of clean water, and then slowly add one-third of an 80 lb (36.4 kg) bag of ARDEX FDX. Once this is blended in, add the next third and so on until all of the material is added. If mixing in a pail, mix with a low speed drill and mixing paddle for approximately 3 minutes to a uniform,
Surface Finish and Sealing

Once the repair has cured for a minimum of 72 hours it can be coated, topped or sealed as specified. Cold and damp conditions may extend this time. To view the toppings, dressing and sealers available from ARDEX, please visit www.ardex.com.

Notes

The working time and pot life of ARDEX FDX are approximately 20 to 40 minutes at 70°F (21°C). Pot life and working time will vary with ambient temperatures.

ARDEX FDX is intended for repairing and resurfacing exterior or interior concrete in institutional, commercial and multi-unit residential areas.

Always install an adequate number of properly located test areas, including the finishes, to determine the suitability of the products for the intended use. As finishes vary, always contact and rely upon the finish manufacturer for specific directives such as maximum allowable moisture content, sealer selection and intended end use of the product.

Never mix with cement or additives. Observe the basic rules of concrete work. Do not install below 50°F (10°C) surface and air temperatures. These temperatures must also be maintained during and for 48 hours after the installation of ARDEX FDX. Install quickly if the substrate is warm, and follow warm weather instructions available from the ARDEX Technical Service Department.

Thickness of Installation

ARDEX FDX can be installed from a minimum of 1 1/2" up to 8" neat (38 mm to 20.3 cm).

Curing

Direct sunlight or wind may cause unwanted rapid surface drying. Keep the surface of the installation damp for 48 hours (light water fogging, curing blanket or curing compound). Do not allow water to puddle. Do not use solvent-borne curing compounds. Note: if the surface is to receive a top coat or other type of finish, use moist curing methods only.

Precautions

ARDEX FDX contains Portland cement and silica. Avoid eye and skin contact. Mix in a well-ventilated area and avoid breathing powder or dust. KEEP OUT OF REACH OF CHILDREN. Carefully read and follow all cautions and warnings on the product label. For complete safety information, please refer to the Material Safety Data Sheet or visit our website at www.ardex.com.
Technical Data According to ARDEX
Quality Standards

All data based on recommended mix ratio at 70°F (21°C)
Physical properties are typical values and not specifications

Mixing Ratio: 6 1/2 pints (3.08 L) of water per 80 lb (36.4 kg) bag
Yield: 0.62 cu. ft. per 80 lb bag (0.0175 m² per 36.4 kg bag)
5 sq. ft. per 80 lb bag at 1 1/2” (0.46 m² per 36.4 kg bag at 38.1 mm)
